Office Automation

Part 1

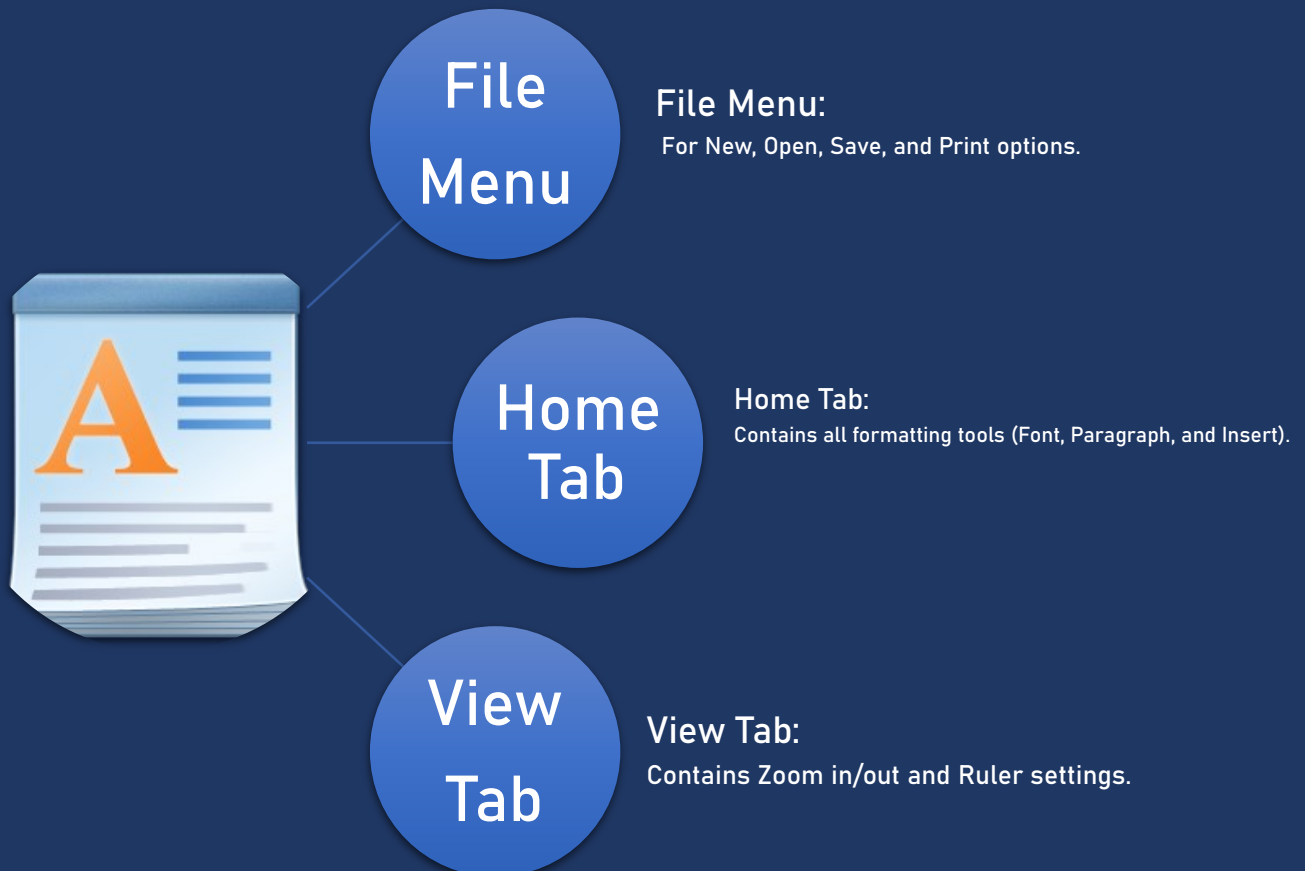

NOTEPAD

Notepad is a simple text editor included with Microsoft Windows. It is a basic tool used to create, open, and read plaintext files.

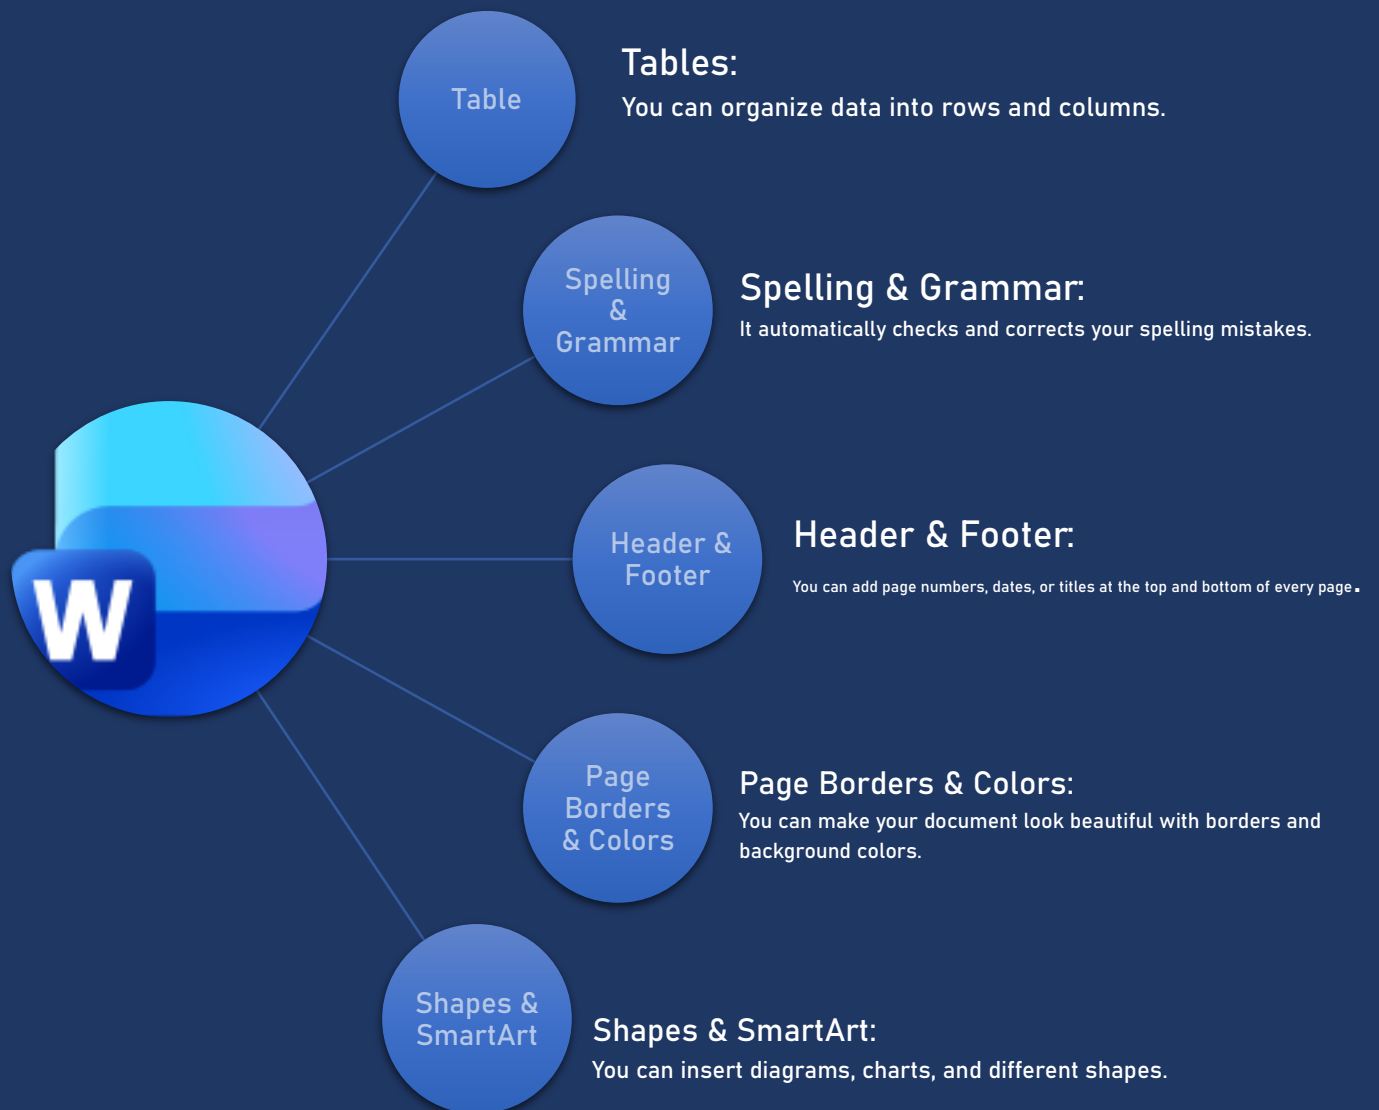

WORDPAD

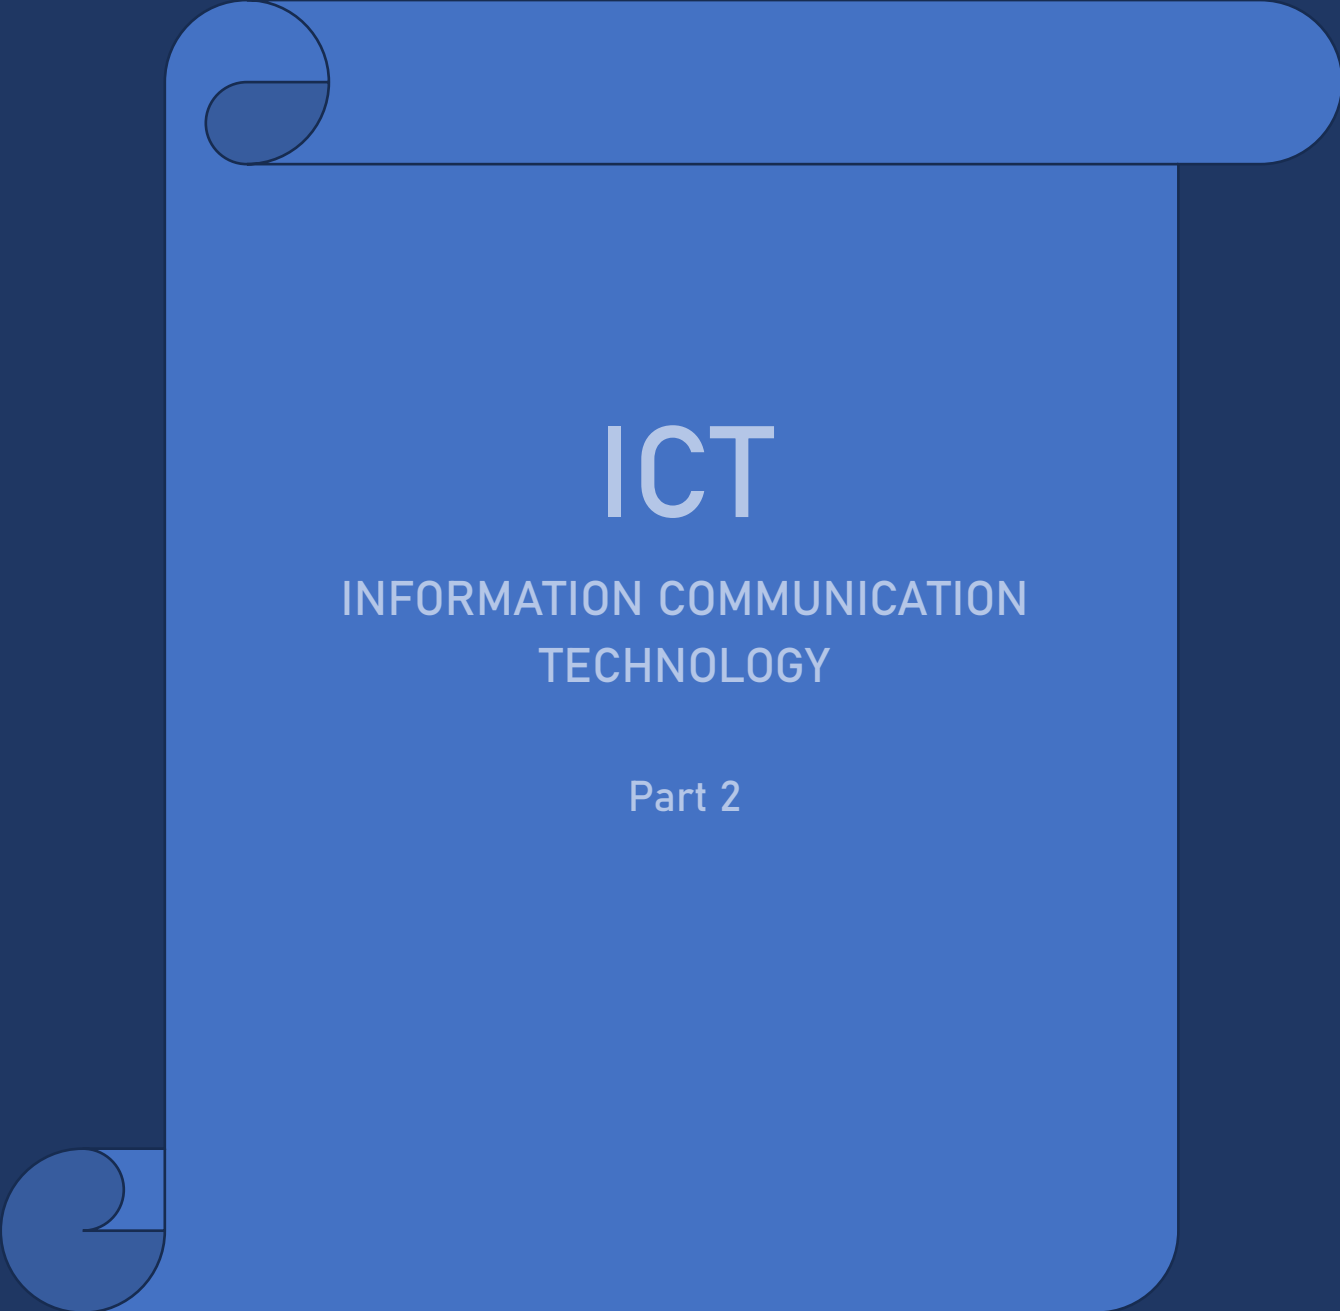

WordPad is a basic word processor provided by Microsoft Windows. It is more advanced than Notepad but simpler than MS Word. It allows you to create documents like letters, notes, and simple reports.

MS WORD

Microsoft Word is a professional Word Processor developed by Microsoft. It is the most powerful tool for creating documents, letters, reports, and assignments. Unlike Notepad and WordPad, it has advanced features for professional formatting.

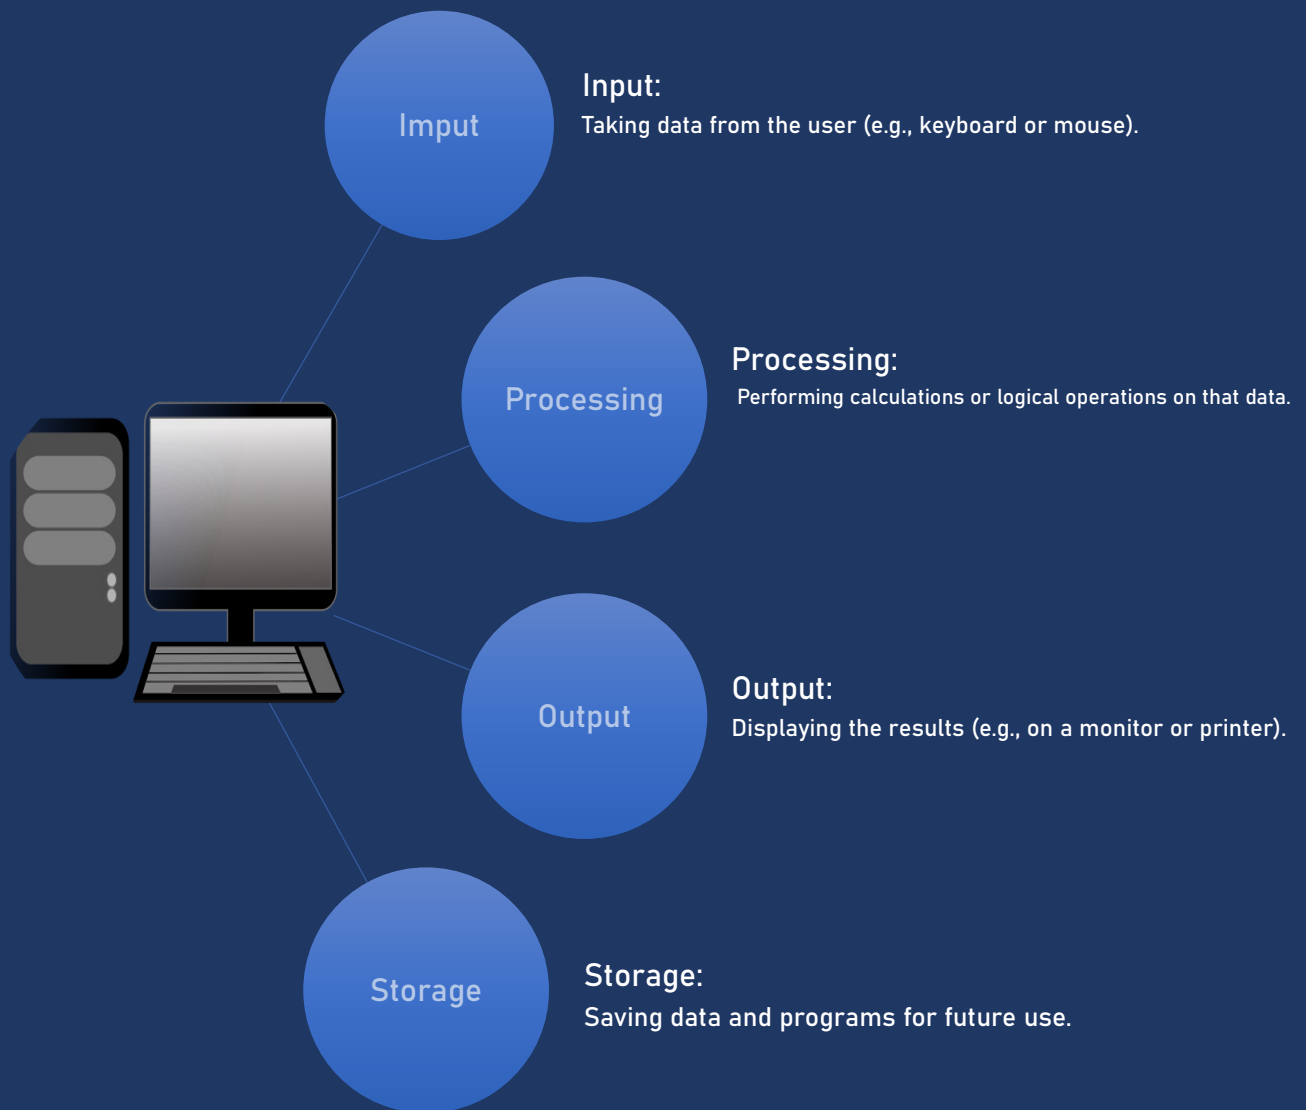

ICT

INFORMATION COMMUNICATION
TECHNOLOGY

Part 2

COMPUTER

A Computer is an electronic device that accepts raw data as input, processes it using a set of instructions (programs), and produces meaningful information as output.

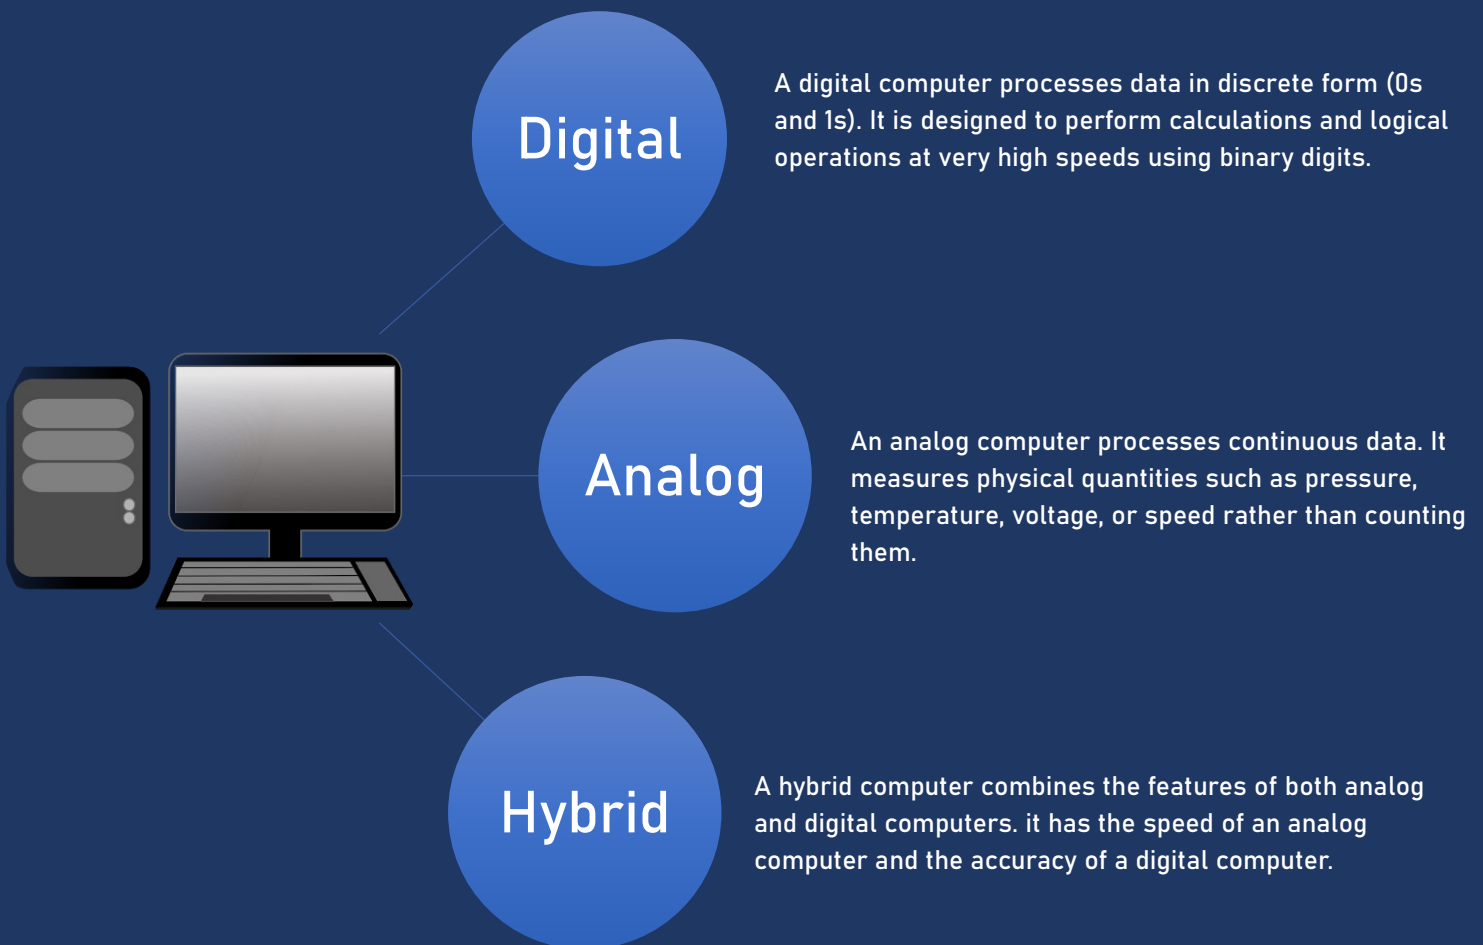

Father Of Computer

Charles Babbage, an English mathematician, designed the first mechanical computer in the mid-1800s called the Analytical Engine.

TYPES OF COMPUTER

Computers are generally categorized into three types based on their data-handling capabilities: Analog, Digital, and Hybrid.

Digital

Digital computers are the most important type because they are the foundation of modern technology.

Classification Of Computer

we did classification of computer in two types.

Size Use

Super: Reserch centers

Mainframe: business professional

Mini: Networking Centilized

Micro: Personal Computer

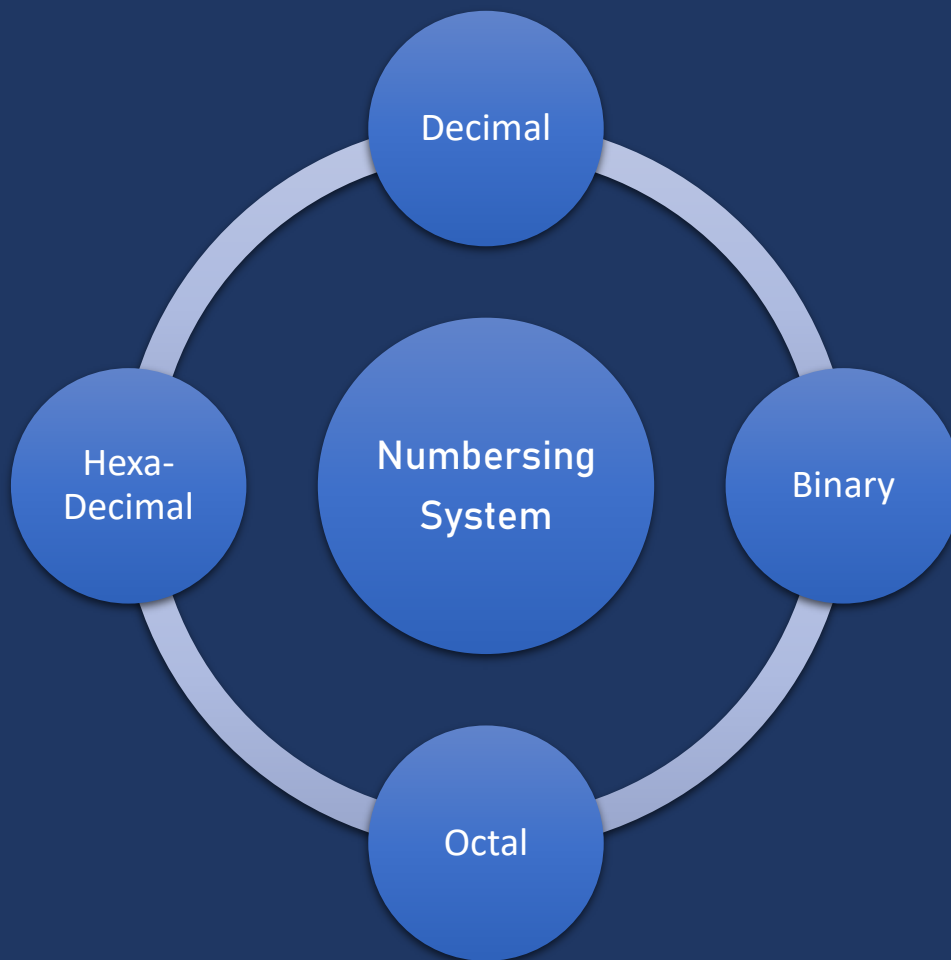

Size Use

Gernel: for local works

Special: for Specific work

Language Of Computer

Computer do not understand numbers the way humans do like(1,2,3). Instead, they use different numbering system to process data.

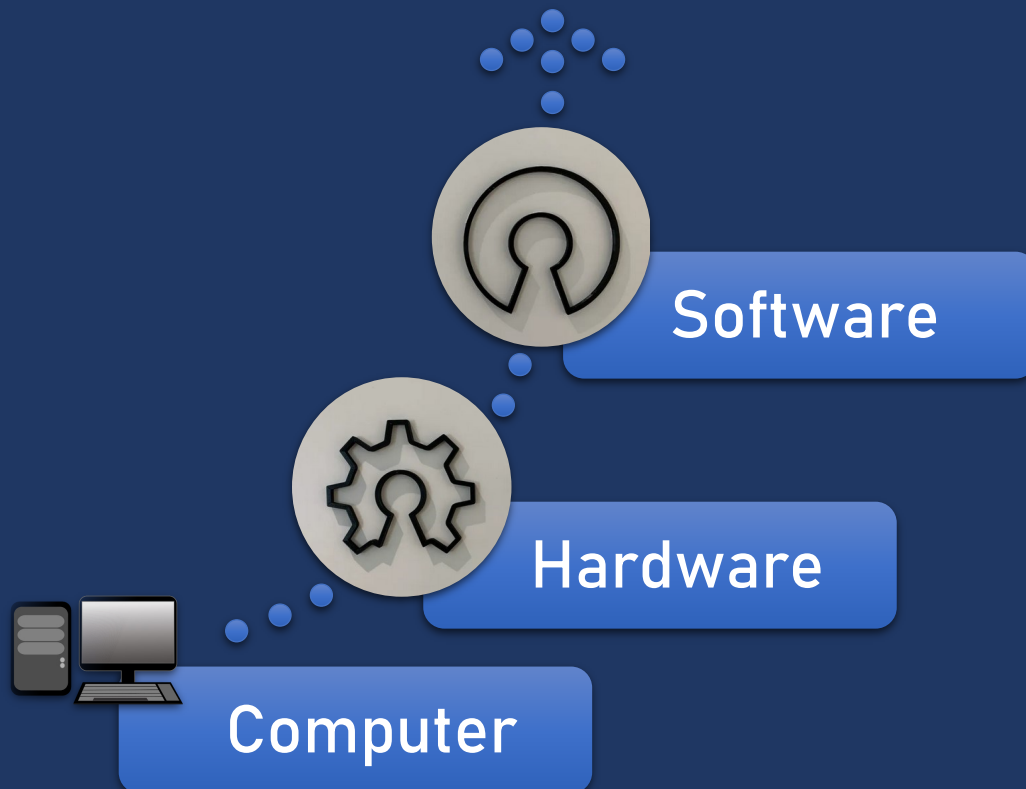

Binary

This is the only language a computer can understand. It uses only two digits 0 & 1. And its Base is 2.

Hardware and Software

Hardware is the physical body of the computer, while software is the set of instructions that tells that body how to function.

Hardware

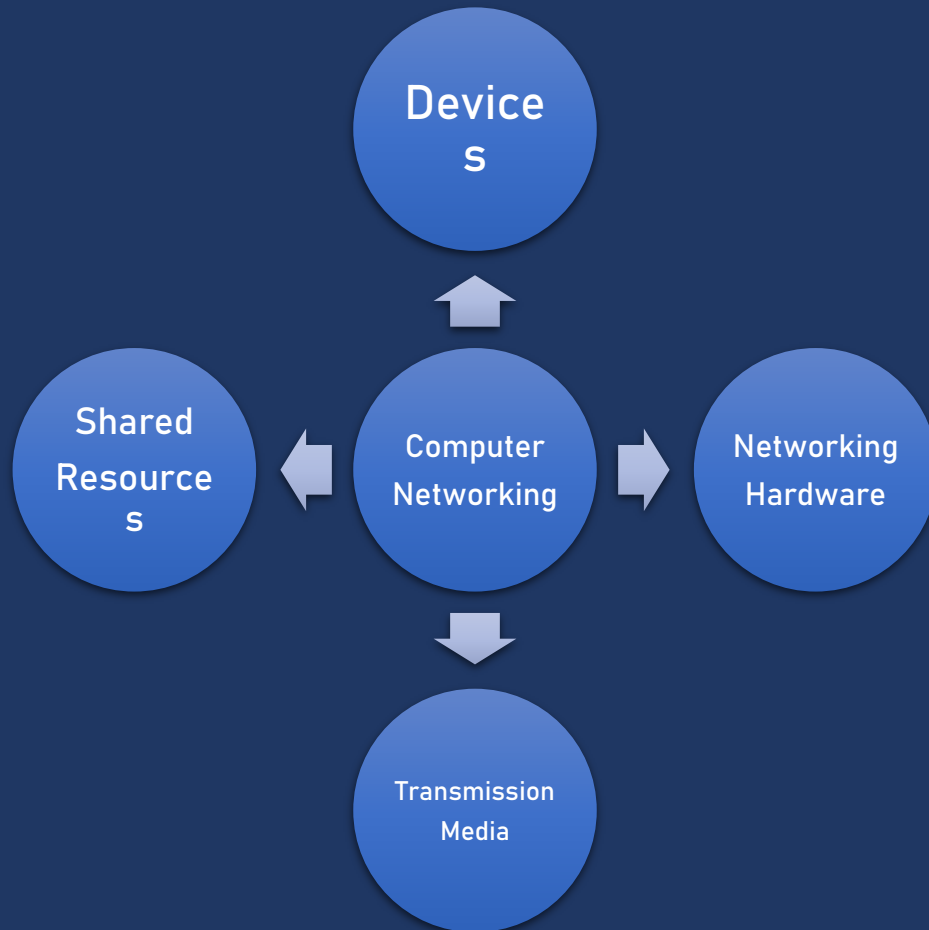

Hardware refers to the physical components of a computer system that you can see and touch.

Software

Software is a collection of instructions, data, or programs used to operate computers and execute specific tasks.

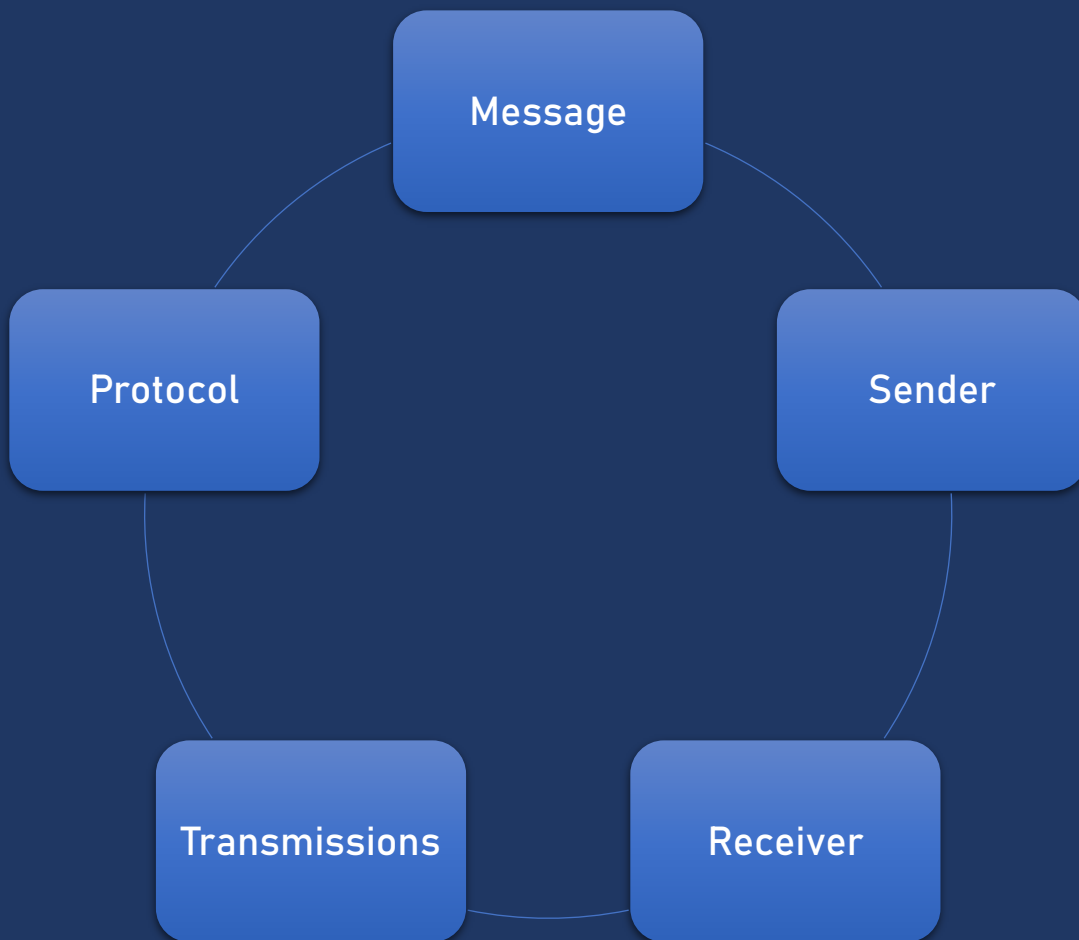

Computer Networking

Computer networking is the practice of connecting two or more computers or devices together to share resources, exchange files, and communicate with each other.

Data Communication

Data communication refers to the exchange of information between two or more devices via some form of transmission medium, such as a wire cable or wireless signal.

Easy to understand

Think of it like a postal service. The Message is your letter, the Sender is you, the Medium is the mail truck, and the Protocol is the Address and Stamp format that the post office requires to deliver it correctly.

A stylized graphic of a blue scroll with a darker blue background. The scroll has a horizontal bar at the top and a vertical section in the center. The corners of the scroll are rounded, and there are decorative elements at the top-left and bottom-left corners that look like the scroll is unrolling. The text is centered on the vertical section of the scroll.

Web Designing

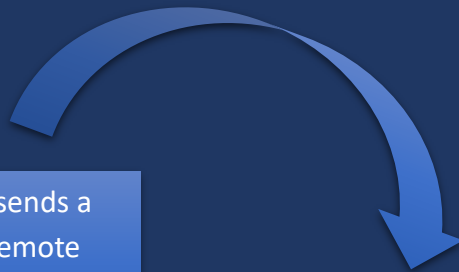

Part 3

Website

A website is a collection of related web pages, images, videos, and other digital asserts that are hosted on at least one web server and accessible via the internet.

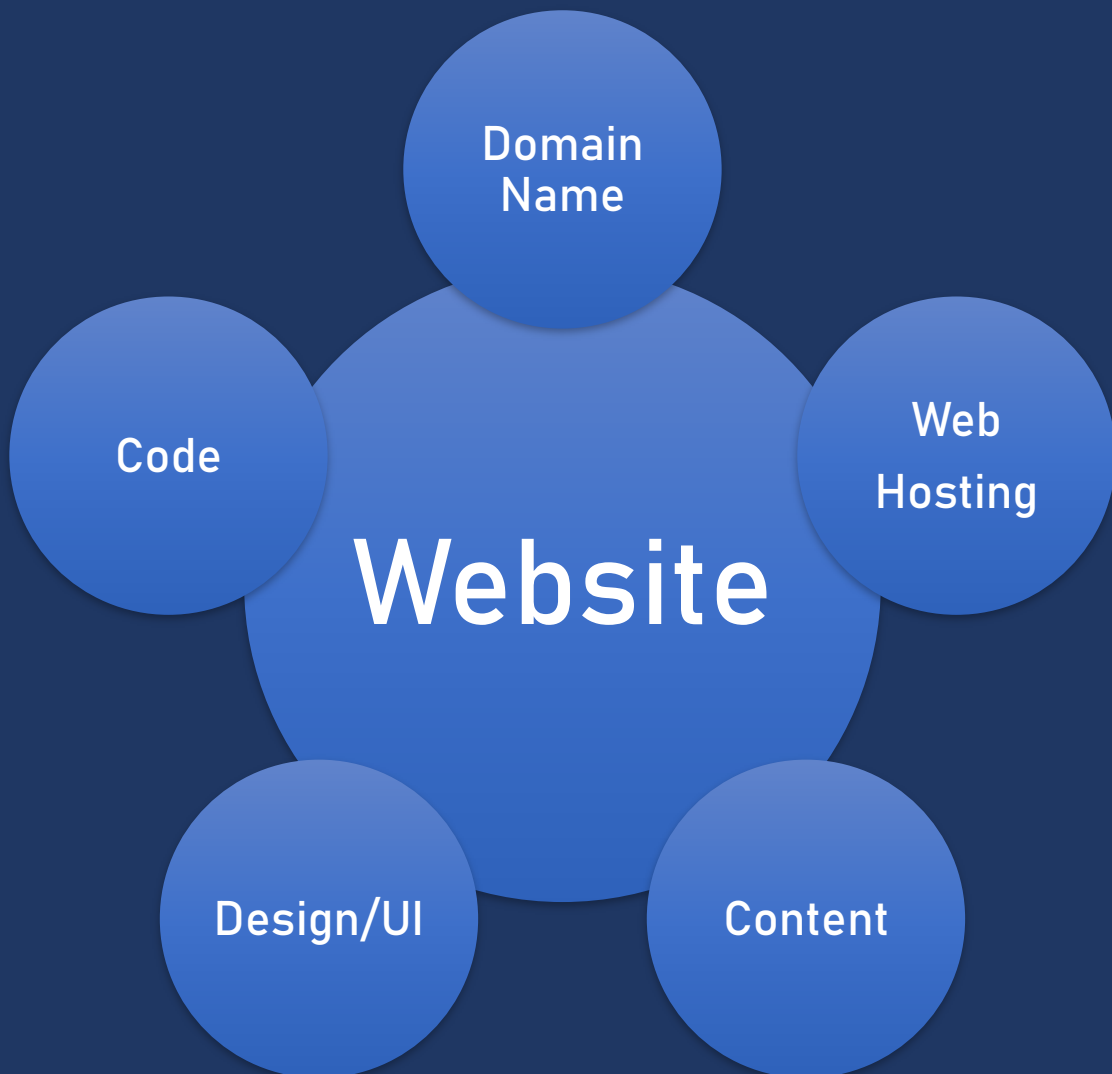

Client Request: The web browser (Client) sends a request for a specific address (URL) to a remote computer called a **Server**.

Server Response: The Server processes that request and sends back the website's files (HTML, CSS, JS), which the browser then displays on your screen.

In simple terms, a website is a collection of digital files stored on a powerful computer called a Server.

Main Components Of Website

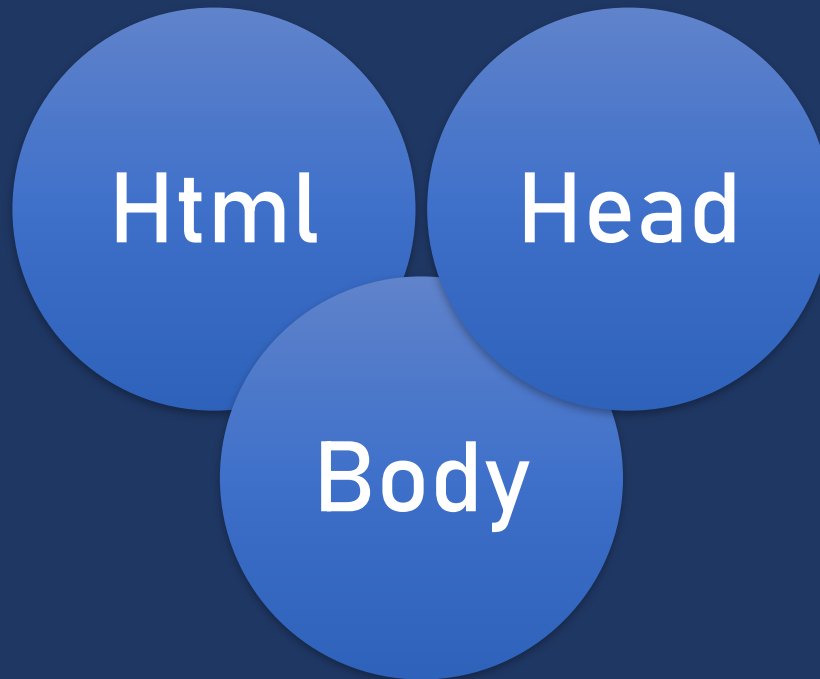

Code (structure)

In simple terms, Code is a set of instructions written in a specific language that tells a computer exactly what to do.

HTML

HTML stands for HyperText Markup Language. It is the standard language used to create the structure of web pages.

Html

It is the "Root" element that wraps everything on the web page.

Head

This section contains Metadata (information about the data).

Body

This is the "Heart" of the website where all the visible content resides.

Tags

An HTML tag is a special keyword surrounded by angle brackets (like `<tagname>`). They are used to mark the start and end of an element so the browser knows if a piece of text is a heading, a link, or an image.

Paired Tags

Tags that have both an opening and a closing tag.

`<h1>...</h1>`, `<b>...</b>`

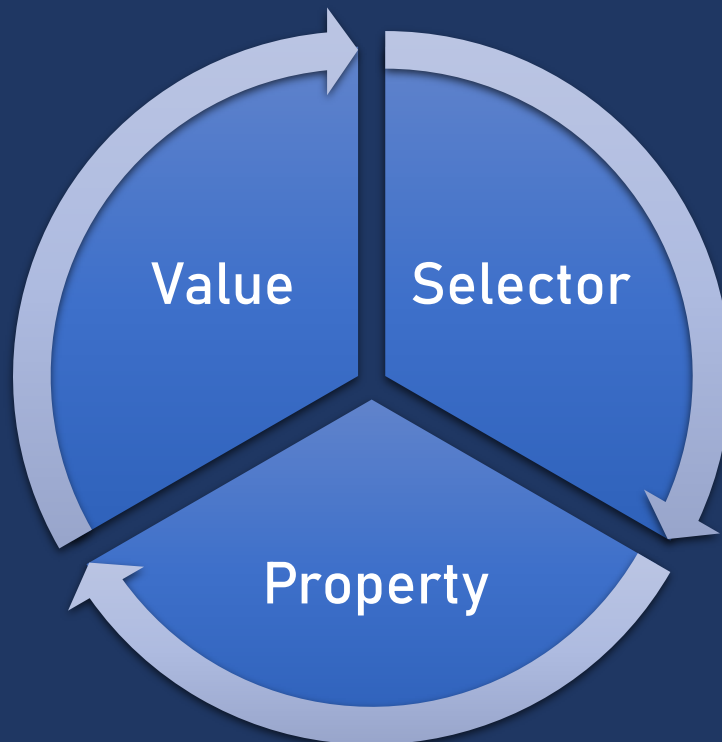

Empty Tags

Tags that do not need a closing tag because they don't contain text.

`<img>`, `<br>`, `<hr>`

CSS

CSS is a design language used to style HTML elements. It controls the presentation of a website, including colors, fonts, spacing, and layouts.

CSS Uses

CSS (Cascading Style Sheets) is a design language used to make web pages look attractive. While HTML provides the basic structure of a page, CSS is used to control the visual presentation, including colors, fonts, and layouts.
